

UNIQUE FEATURES

Our difference from other systems is hidden in the real solutions
we provide.

MEASUREMENT OF SLEEPING TIME

By measuring the daily sleep time of animals, we detect stress, illness and productivity decreases early. The decrease in sleep duration, when analyzed together with ruminant activity, provides high accuracy in the early diagnosis of diseases.

Continuous Data Tracking

Dairycollar protects your business against power outages.

Even if there is no energy in the in-barn receiving antennas, Dairycollar can store data for up to 8 hours on their own.

In this way, there is no data loss, the system does not fail and the company continues to monitor without being affected by interruptions.

Freedom of Device Selection: S-Tag + Dairycollar

Dairysense has in-barn antennas that can operate S-Tag (pedometer) and Dairycollar (collar) devices simultaneously in the same enterprise.

Thanks to this, it is possible to optimize the cost in large enterprises:

By using S-Tag on heifers and Dairycollar on milking cows, the entire herd can be managed through a single system.

This flexibility provides both economic advantage and data integrity.

Milkmeter with Long Service Life and Low Risk of Malfunction

Dairysense milk meters do not have a solenoid valve. Control is provided directly via the pulsator. In this way, frequent valve failures are prevented over time and the system works smoothly for many years.

Intelligent Identification For Trouble-Free Milking

Dairysense не использует switch на калитках доильного зала, что устраняет неисправности, вызванные переключателем и потребности в обслуживании. Идентификация начинается, как только нажата клавиша начала доения, и идентификация происходит со скоростью до 0,25 сек.

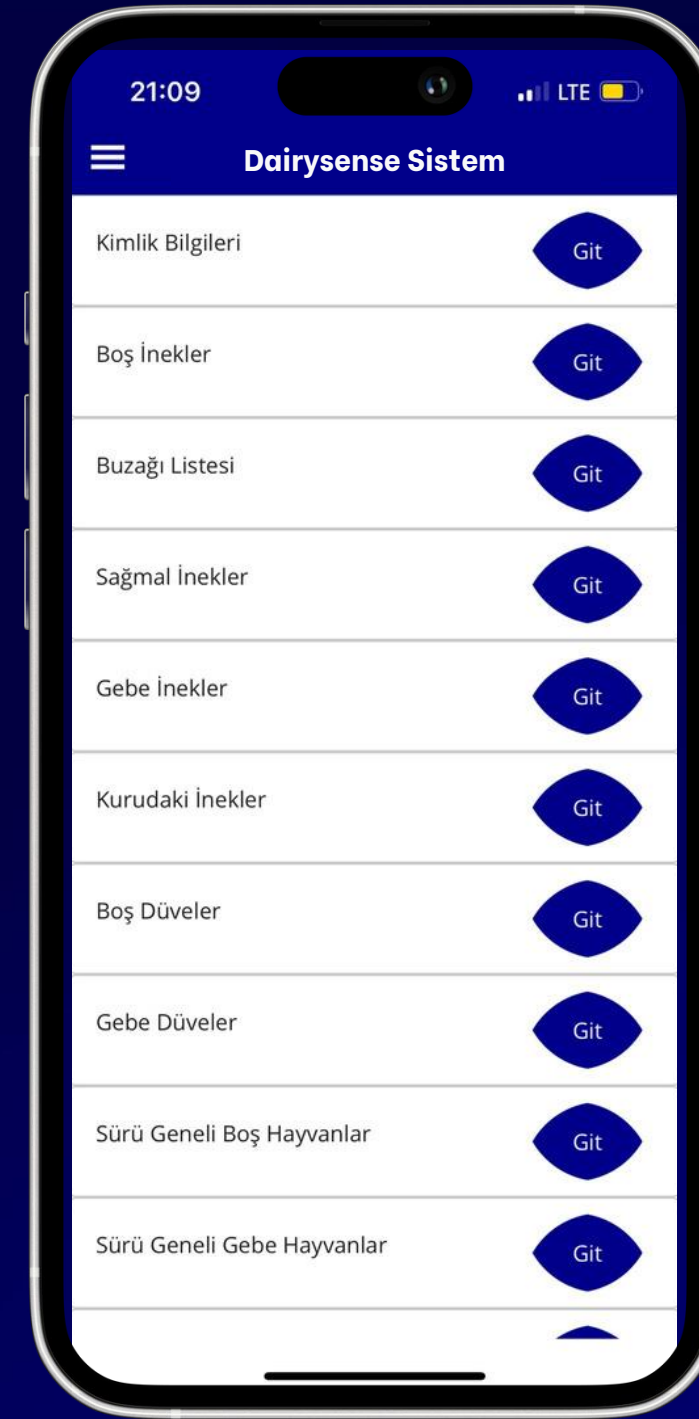

При определении предлагаются два варианта:

1. Неопознанное животное не доится, вводится номер вручную.
2. Доеение производится без идентификации, и скрининг продолжается во время доения

Fast Access to User-customized Reports from Mobile

In addition to traditional e-mail notifications, Dairysense also sends notifications via computer interface, mobile application, Telegram and SMS. Thanks to Telegram notification management, unlimited notifications can be delivered to unlimited users in the farm and the system hierarchy structure can be easily established. This multi-channel structure increases flexibility and efficiency in communication.

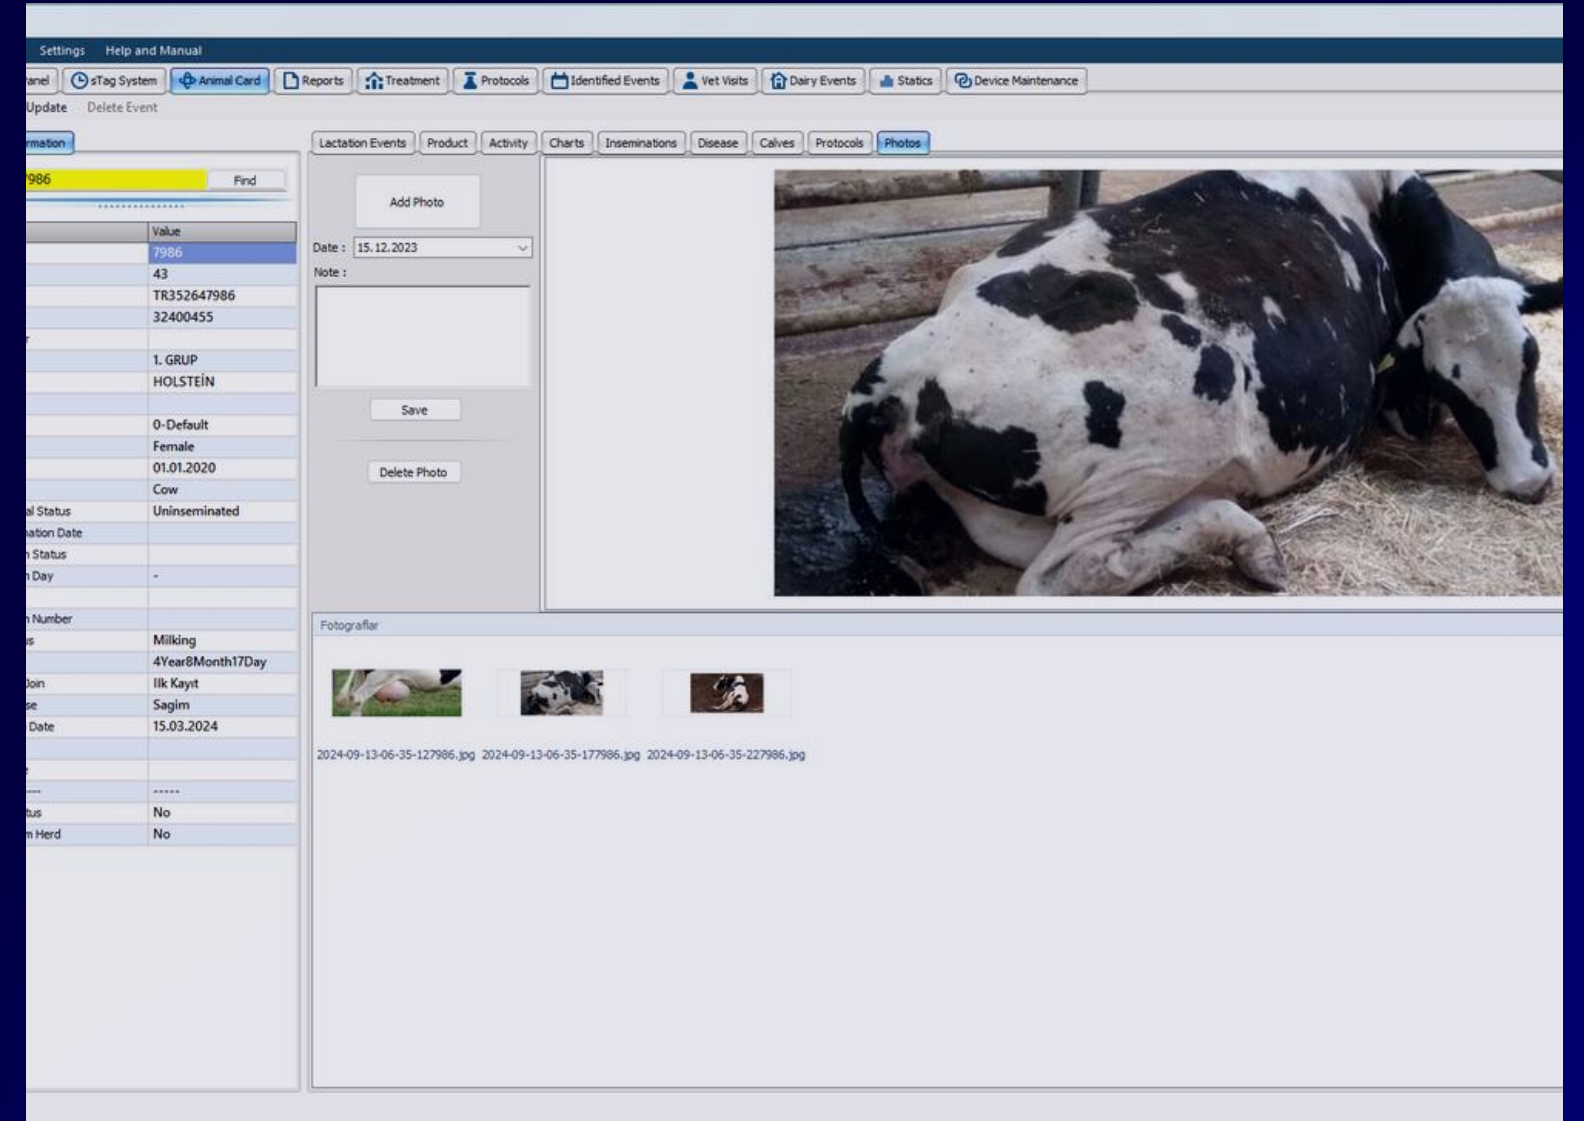

Animal Photo Tracking with Mobile Application

You can enter the animal card via the mobile application, take a photo of the animal and save it.

The ear tag can easily help to detect sick animals, thus making management easier.

A veterinarian who is far away for treatment can make a quick and accurate intervention by looking at the photos without going near the animal.

In addition, all photos are archived and a comprehensive visual recording system is created in your business.

Easy Management with Visual Plugins to Reports

You can save the special reports you have prepared by enriching them with icons and colors. In this way, report management becomes more visual, understandable and easy.

Intelligent Reporting that Eliminates Excel Dependency

One of the most challenging processes in herd management is transferring reports to Excel and entering data manually.

Dairysense allows you to add your own columns in the reports you create and enter data into these columns directly from within the program.

In addition, thanks to the filtering options, it reduces the use of Excel and greatly simplifies your workforce.
